

1 Features

- Low power Consumption
 - 5Hz Version: 1.6uA@1.8V (typical)
 - 20Hz Version: 3.3uA@1.8V (typical)
- Supply Voltage: 1.6V~5.5V
- High Magnetic Sensitivity
 - B_{OP}= 22Gs B_{RP}= 16GS
 - B_{OP}= 33Gs B_{RP}= 23GS
 - B_{OP}= 46Gs B_{RP}= 34GS
- Magnetic Type: Unipolar
- No External Pull-up Resistors Required
- Package: SOT-23-3L
 SOT-553
 TO-92S
- Operating Temperature: -40°C~85°C
- High ESD Rating: HBM 8KV
- RoHS Compliant

2 Applications

- Cover switch in notebook PC/PAD
- TWS Earphones
- Door, Lids and Tray Position Switches
- Water, electric and gas utility meters
- Level, proximity and position switch

3 Typical Application

Note: C_{IN} is for stabilization and to strengthen the noise immunity, the recommended capacitance is 1 µF typical and should be placed as close to the supply pin as possible.

4 Descriptions

The KTH1611 is a miniature micropower magnetic Hall effect switch IC with single output. The temperature compensation circuitry improves stability of magnetic switch points over the whole operating range. If the magnetic flux density perpendicular to the part marking surface is larger than operating point (BOPS), the output will be turned on; if it is less than releasing point (BRPS), the output will be turned off. Designed for battery powered consumer equipment, home applications and industrial applications, the average supply current is only 1.6µA at 1.8V. To support portable equipment the KTH1611 can operate over the supply range of 1.6V to 5.5V.

The KTH1611 family provides a variety of package to customers: SOT-23-3L, SOT-553 for surface mount and TO-92S flat for through-hole mount. All package are RoHS compliant.

7 Output Switching Characteristics

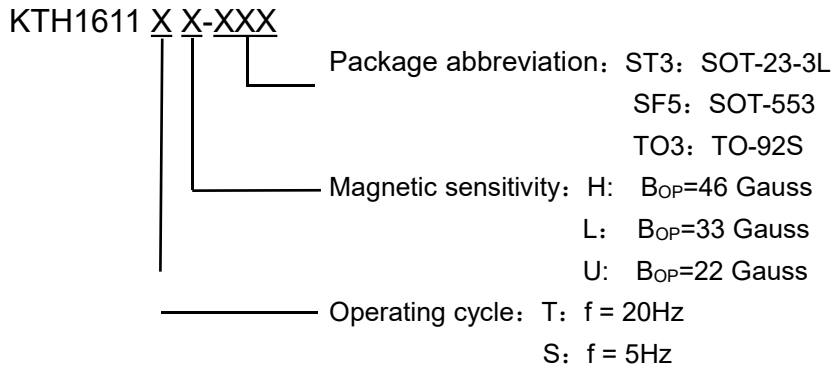

As shown in the figure below, when the South Pole of the magnet is near the top of the chip, the magnetic induction line passes from the bottom of the chip to the top. It is considered that the magnetic induction intensity B is positive at this time. When the North Pole of the magnet is near the top of the chip, the magnetic induction line passes from the top of the chip to the bottom, and the magnetic induction intensity B is considered to be negative.

As shown in the figure below, KTH1611 can detect the magnetic fields of the the South Pole.
